

PhotoEditor – Mac Installation Guide

PhotoEditor is distributed as a standalone Mac application. Because it is not published through the Mac App Store, macOS will show several security prompts during the first launch. This is normal and expected – follow the steps below to complete the installation.

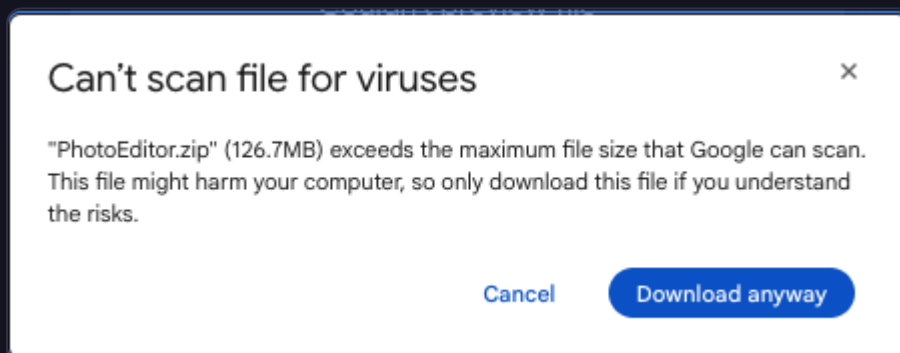

Table of Contents

- ▶ Step 1: Download
 - ▶ Step 2: Open the App
 - ▶ Step 3: Allow in Privacy & Security
 - ▶ Step 4: Confirm
 - ▶ Troubleshooting
-

1 Download

Download **PhotoEditor.zip** from the shared Google Drive link. Your browser will warn that the file is too large for Google to scan for viruses.

Click **"Download anyway"** to proceed.

This warning appears because the file exceeds Google's 100MB scan limit. The app is safe to download.

2 Open the App

Unzip `PhotoEditor.zip` and double-click **PhotoEditor.app** to launch it. macOS will block the app and show this warning:

Click **"Done"** – do NOT click "Move to Trash."

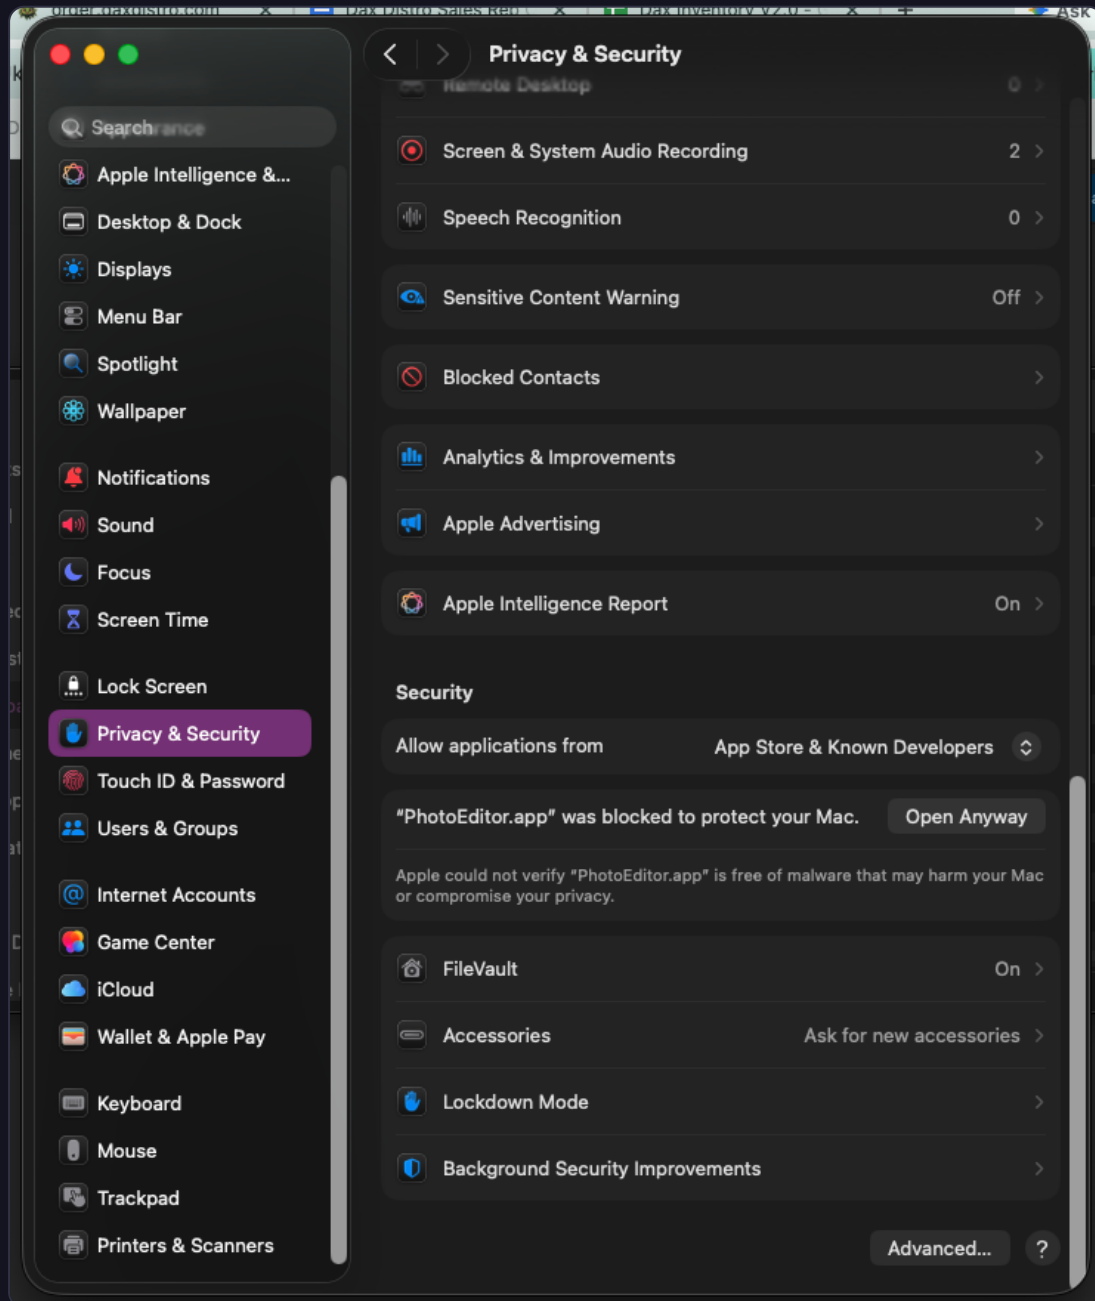

macOS blocks apps from unidentified developers by default. The next steps will override this.

3 Allow in Privacy & Security

Open **System Settings** and navigate to **Privacy & Security**. Scroll down to the **Security** section. You will see a message:

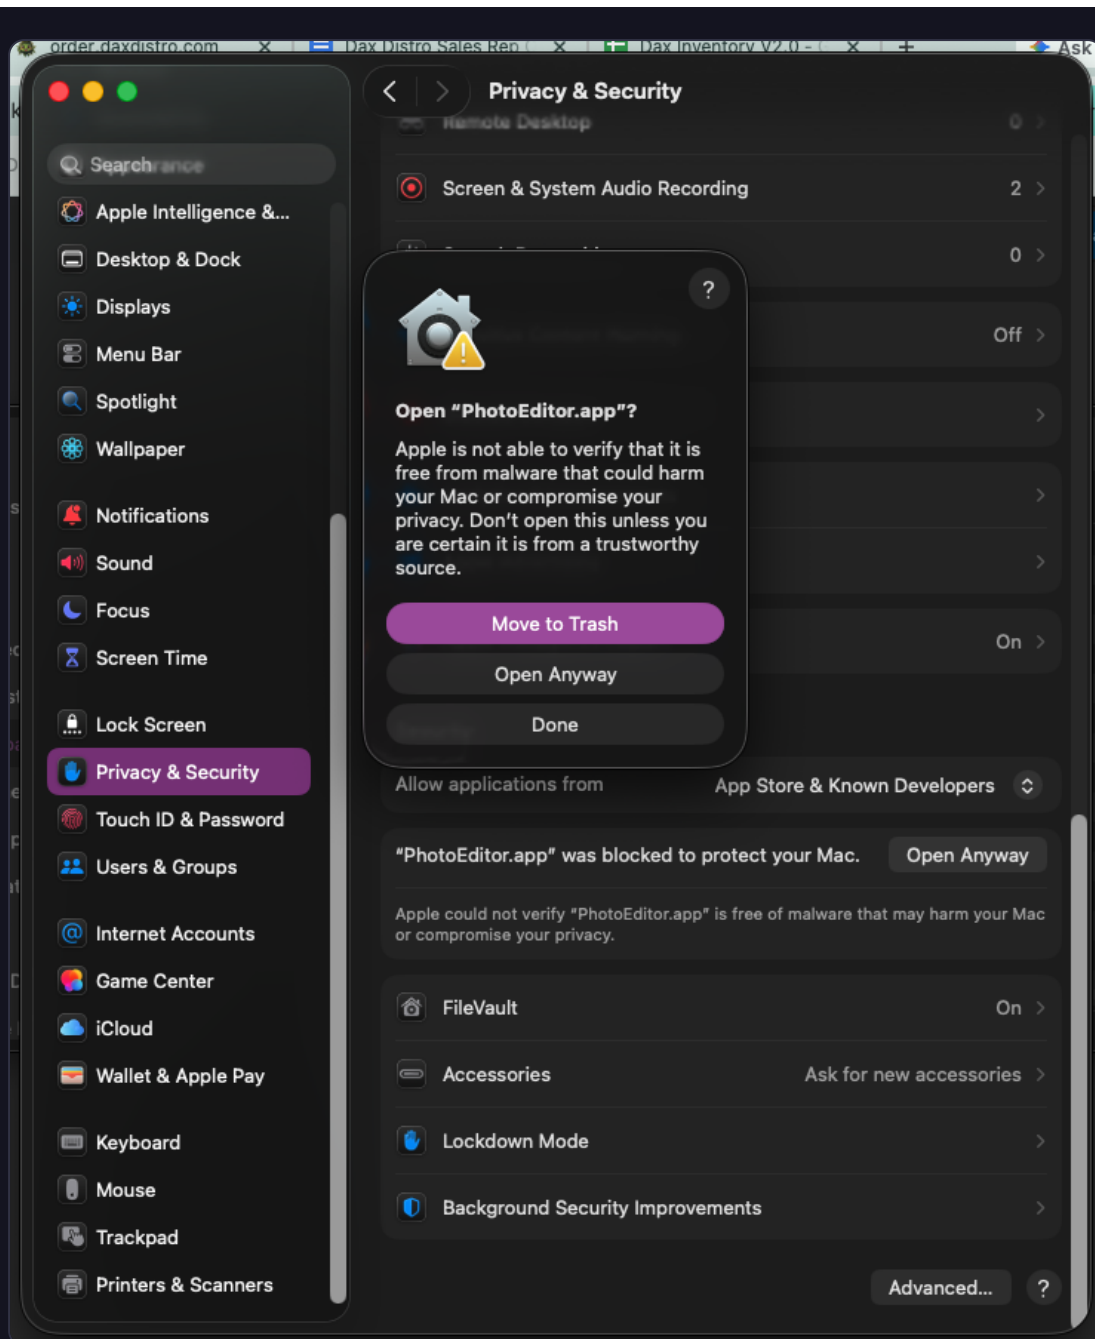

"PhotoEditor.app" was blocked to protect your Mac.

Click **“Open Anyway”**.

4 Confirm

macOS will show one final confirmation. Click **“Open Anyway”** to launch PhotoEditor.

You only need to do this once. Future launches will open the app normally without any warnings.

Troubleshooting

Issue	Solution
"Open Anyway" not visible in Privacy & Security	You must attempt to open the app first (Step 2). The option only appears after a blocked launch attempt.
App won't open after clicking "Open Anyway"	Try right-clicking the app and selecting "Open" from the context menu.
"PhotoEditor.app is damaged"	Re-download the zip file. The archive may have been corrupted during download.
App opens but crashes immediately	Ensure you are running macOS 12 (Monterey) or later.
